Summary

Software engineer with 6 years in fintech, developer tools, and AI media products. Most recently led an AI media generation platform across frontend, APIs, database, payments, auth, and release infrastructure. Before that, led frontend for an RBI-licensed payment aggregator from launch to 50K+ monthly active users.

Experience

Lead Software Engineer Mar 2026 to Sep 2026
FanPro Studio, AI media generation platform *United Arab Emirates (Remote)*

- Built an AI media generation platform from an empty repository to public beta in **June 2026**. Shipped **4 generation modes** (image, video, UGC, and AI influencer creation) with **20 generation types**, plus onboarding, an asset library, and a creator marketplace. Stack: Next.js 16, React, TypeScript.
- Built the generation backend: API routes and server actions that submit jobs to AI model providers, background jobs that track status, and provider webhooks that store results.
- Integrated Stripe and WorkOS end to end: checkout, webhook handlers that grant and deduct usage credits, and session handling.
- Built social publishing for creators: a backend-for-frontend layer over the publishing provider built with server actions, OAuth account connection, a content calendar, and a post composer for **11 social platforms**.
- Set up Datadog monitoring and a **4-environment** release process (main, staging, UAT, production) using semantic-release, commitlint, Husky, and approval-gated production deploys. Patched Next.js off a CVE-affected version.
- Built product analytics from scratch: signup-to-checkout funnels, generation conversion (prompt typed to generation run), token usage per generation, server-side referral tracking, and Google Ads and Meta attribution.
- Cut Cumulative Layout Shift on the explore page from **0.66 to 0.003** by replacing a reflowing hover sidenav with an overlay. Fixed a canvas animation that froze browsers.
- Traced an **8.3s** LCP delay to a **14.8MB** JS chunk, an image proxy chain, and render-blocking fonts. Defined the fix: CDN-ready images at generation time, server rendering for the first fold, and virtualized infinite scroll.
- Mentored **3** engineers and set up the team's AI-assisted development workflow: repository-level agent instructions, parallel agent sessions in git worktrees, Figma-to-code through MCP, and a review checklist for agent-written code.

Lead Software Engineer May 2022 to Mar 2026
EximPe, RBI-licensed cross-border payment aggregator (PA-CB) *Bangalore, India (Remote)*

- Founding team hire. Built and owned the customer, admin, and sales web apps from launch to **50K+ monthly active users**, integrating with Django services and Java banking APIs.
- Led the frontend team. Set code review, testing, and release standards that cut production incidents by **60%** (Sentry).
- Rebuilt core payment flows: transaction time down **30%** (internal dashboard), JS bundle down **40%** through tree shaking and code splitting, Lighthouse performance up from **39 to 81**.
- Raised mobile KYC completion from **25% to 85%** by finding drop-off steps in funnel analytics and A/B testing redesigned flows.
- Built a design system of **80+** Storybook components, used across all **3** applications.
- Delivered RBI-aligned payment and KYC flows with backend, security, and compliance teams. Fixed VAPT audit findings and dependency scan alerts. Added CSP, CSRF, and XSS defenses.

Software Development Engineer II Aug 2021 to Apr 2022
SAWO Labs, passwordless authentication *Bangalore, India (Remote)*

- Built frontend and backend features for a passwordless authentication product integrated by **500+ applications**.
- Reduced automated abuse on authentication endpoints by **60%** by adding rate limiting, CAPTCHA, and device checks.
- Wrote SDK documentation and ran developer workshops that cut typical integration time from days to hours.

Software Engineer Oct 2020 to Jul 2021
QBurst *Kochi, India*

- Built an internal expense-splitting application end to end with React, Node.js, and Express: REST API, data model for groups, expenses, and balances, and the web client.

Project

CastMeIn, talent marketplace mobile app May 2024 to Sep 2024
Side project

- Built a React Native app with a GraphQL API connecting casting directors and actors, covering profiles, casting calls, and applications. Launched to test users; not published to app stores.

Technical Skills

Languages: TypeScript, JavaScript, Java, SQL
Backend: Node.js, Express, Next.js route handlers and server actions, REST, GraphQL, webhooks, background jobs, PostgreSQL, MongoDB
Frontend: React, Next.js, React Native, Tailwind CSS, React Query, Zustand, Redux
Payments and Auth: Stripe, WorkOS, OAuth
Infrastructure and Tooling: Vercel, Datadog, Sentry, GitHub Actions, semantic-release, Docker, Playwright, Jest

Education

Govt. Model Engineering College 2016 to 2020
B.Tech in Computer Science and Engineering *Kochi, India*
